**Attention: Mr. Laurie Danielson**

Dear Mr. Danielson:

**Reference: Spring, 2009 Groundwater Monitoring Field Program**

Stantec Consulting Ltd. is pleased to present the analytical results of the spring, 2009 field program as an ongoing part of the Regional Groundwater Quality Study of the Beverly Channel. The following sections detail our field program and the analytical results for the 13 NCIA groundwater monitoring wells (Figure 1).

## **FIELD PROGRAM**

Prior to starting the field program, landowners were contacted to make them aware of the work and request access, arrange permitting and discuss safety protocols. Stantec personnel attempted to begin the monitoring program on March 31, 2009, however due to snow depth were unable to access many of the wells.

Groundwater monitoring and sample collection was completed on April 21 and 22, 2009. Prior to sampling, water level measurements were obtained and all of the monitoring wells were purged to remove stagnant water. A minimum of 3 well volumes were purged from each monitoring well using a Rediflo stainless steel submersible pump. The Rediflo pump was subsequently used to obtain water samples for analysis. Field measurements of temperature, pH and electrical conductivity (EC) were taken at the time of sampling using handheld pH and EC meters. Both meters were calibrated daily, prior to sampling. A duplicate sample was taken from monitor MW-09 during the sampling event for quality control purposes. The duplicate sample was prepared by rinsing a clean 4 L plastic container with formation water, collecting the required sample volume, and splitting the sample into two aliquots.

All groundwater samples were submitted to Maxxam Analytics Inc. in Edmonton for analysis on the day of collection. Groundwater samples from the April, 2009 sampling event were analyzed for routine water quality parameters, major ions, dissolved organic carbon, hydrocarbon parameters and dissolved metals. At the time of collection, all of the sample bottles were labeled with the site number, date of collection, and the analyses required. Dissolved metals samples were filtered and preserved in the field. Sample bottles were placed into a cooler with ice packs and delivered to Maxxam Analytics Inc. in Edmonton at the end of each sampling day.

**Reference: Spring, 2009 Groundwater Monitoring Field Program**

Figure 2 presents a groundwater hydrograph for all 13 of the monitoring wells included in the network. Examination of the figure reveals that groundwater levels within the sands and gravels of the Beverly Channel have remained relatively stable for all monitoring wells over the time period between 2005 and 2009. A slight decline in water level elevations (approximately 1 m) was noted for monitoring wells MW-03, MW-05, and MW-13 during the November, 2005 monitoring event. Water levels averaged 0.1 m higher in April, 2009 compared to May, 2005.

Figure 1 presents the potentiometric surface for the sands and gravels of the Beverly Channel. Groundwater elevations are the highest in the southwest and decrease to the northeast. Generally, groundwater appears to flow from eastern areas of the Beverly Channel towards the North Saskatchewan River with an additional component of northwesterly flow along the Beverly Channel. Potentiometric gradients vary from a minimum gradient of 0.0005 m/m near MW-12 and MW-13 to a maximum gradient of 0.003 m/m on the north side of the City of Fort Saskatchewan.

## **ANALYTICAL RESULTS**

Analytical results from the spring, 2009 groundwater monitoring program have been received from Maxxam Analytics Inc. Table 1 (attached) presents a summary of the analytical results for the 13 monitoring wells sampled during the spring, 2009 sampling event. The *Guidelines for Canadian Drinking Water Quality* (GCDWQ) (Health Canada, 2008) are included in the table for comparative purposes. Copies of the laboratory reports are also appended to this letter for your reference.

The reproducibility of the data was assessed by calculating the relative percent difference (RPD) between the sample and duplicate results. Duplicate results are considered acceptable when the RPD is below 20% or, when at least one of the duplicate results is less than or equal to five times the parameter detection limit, the absolute difference (AD) between the results is less than or equal to the detection limit. All of the duplicate results except copper and F2 fraction hydrocarbons met these criteria for this sampling event and were considered acceptable.

Based on the analytical results presented in Table 1, several exceedances of the GCDWQ were noted. Exceedances were similar to previous sampling events with total dissolved solids (TDS), iron and manganese concentrations above guideline levels in most of the monitoring wells. TDS, manganese and iron commonly exceed GCDWQ in this area, and concentrations above the guidelines are not unexpected. Further, the guideline criteria for these three parameters are based on aesthetic objectives at the point of consumption.

Sodium concentrations were above the GCDWQ at monitors MW-07 and MW-09, which had been observed during previous sampling events. The sulphate concentration at monitor MW-07 also remained above the 500 mg/L GCDWQ with a concentration of 1,200 mg/L. Sulphate concentration decreased below the GCDWQ in monitor MW-06, which had reported a concentration of 560 mg/L during the previous fall, 2007 monitoring event. The GCDWQ for sodium and sulphate are also aesthetic objectives.

Chloride concentrations remain elevated at MW-04 with a concentration of 150 mg/L in April, 2009. The historical average chloride concentration in all of the monitoring wells, excluding MW-04, is 11

**Reference: Spring, 2009 Groundwater Monitoring Field Program**

mg/L. Consideration should be given to an investigation to assess the nature and potential sources of elevated chloride concentrations in the vicinity of monitor MW-04.

All samples analyzed reported concentrations of dissolved metals lower than respective method detection limits or within the above noted guideline.

Petroleum hydrocarbon compounds were below guideline concentrations in all of the monitoring wells in the network. Monitoring well MW-09 reported F2 fraction hydrocarbons slightly above the detection limit with a reported concentration of 0.3 mg/L, however the duplicate sample result was below the detection limit (<0.1 mg/L). The detection is considered to be anomalous based on the duplicate result and because F2 fraction hydrocarbons have not been detected at this monitor or any other monitor in the network over the 6 sample historical record. Future sampling will confirm or refute this assumption. All other parameter concentrations were similar to previous sampling events.

**CLOSURE**

We trust that this summary of the fieldwork and analytical results meets your needs. If you have any questions or comments regarding this summary, please do not hesitate to contact us.

Best regards,
